Local and Cloud Instance (Elasticsearch + Kibana)

Four words, then everything else is assembly

Tool

One capability the agent can call. Search an index, run a query, trigger a workflow.

Workflow

Deterministic steps in YAML. Where you take the guessing away from the model.

Skill

Instructions, persona, and the tools it is allowed to reach for.

Agent

The harness. Tools plus skills plus an LLM, with chat and an A2A endpoint.

How To Build A Tool in ES? Where Do I Start?

The screenshot displays the Elasticsearch Query Layer interface. At the top, there's a header with 'New session', 'Untitled', and a '+'. On the right, there are buttons for 'Switch to Classic', 'Save', and a dropdown. Below the header, there's a 'Search' button, a refresh icon, a lightning bolt icon, a date range selector set to 'All time', and navigation arrows. A tooltip for 'fetches_at: date' is visible. The main query editor contains the following query:

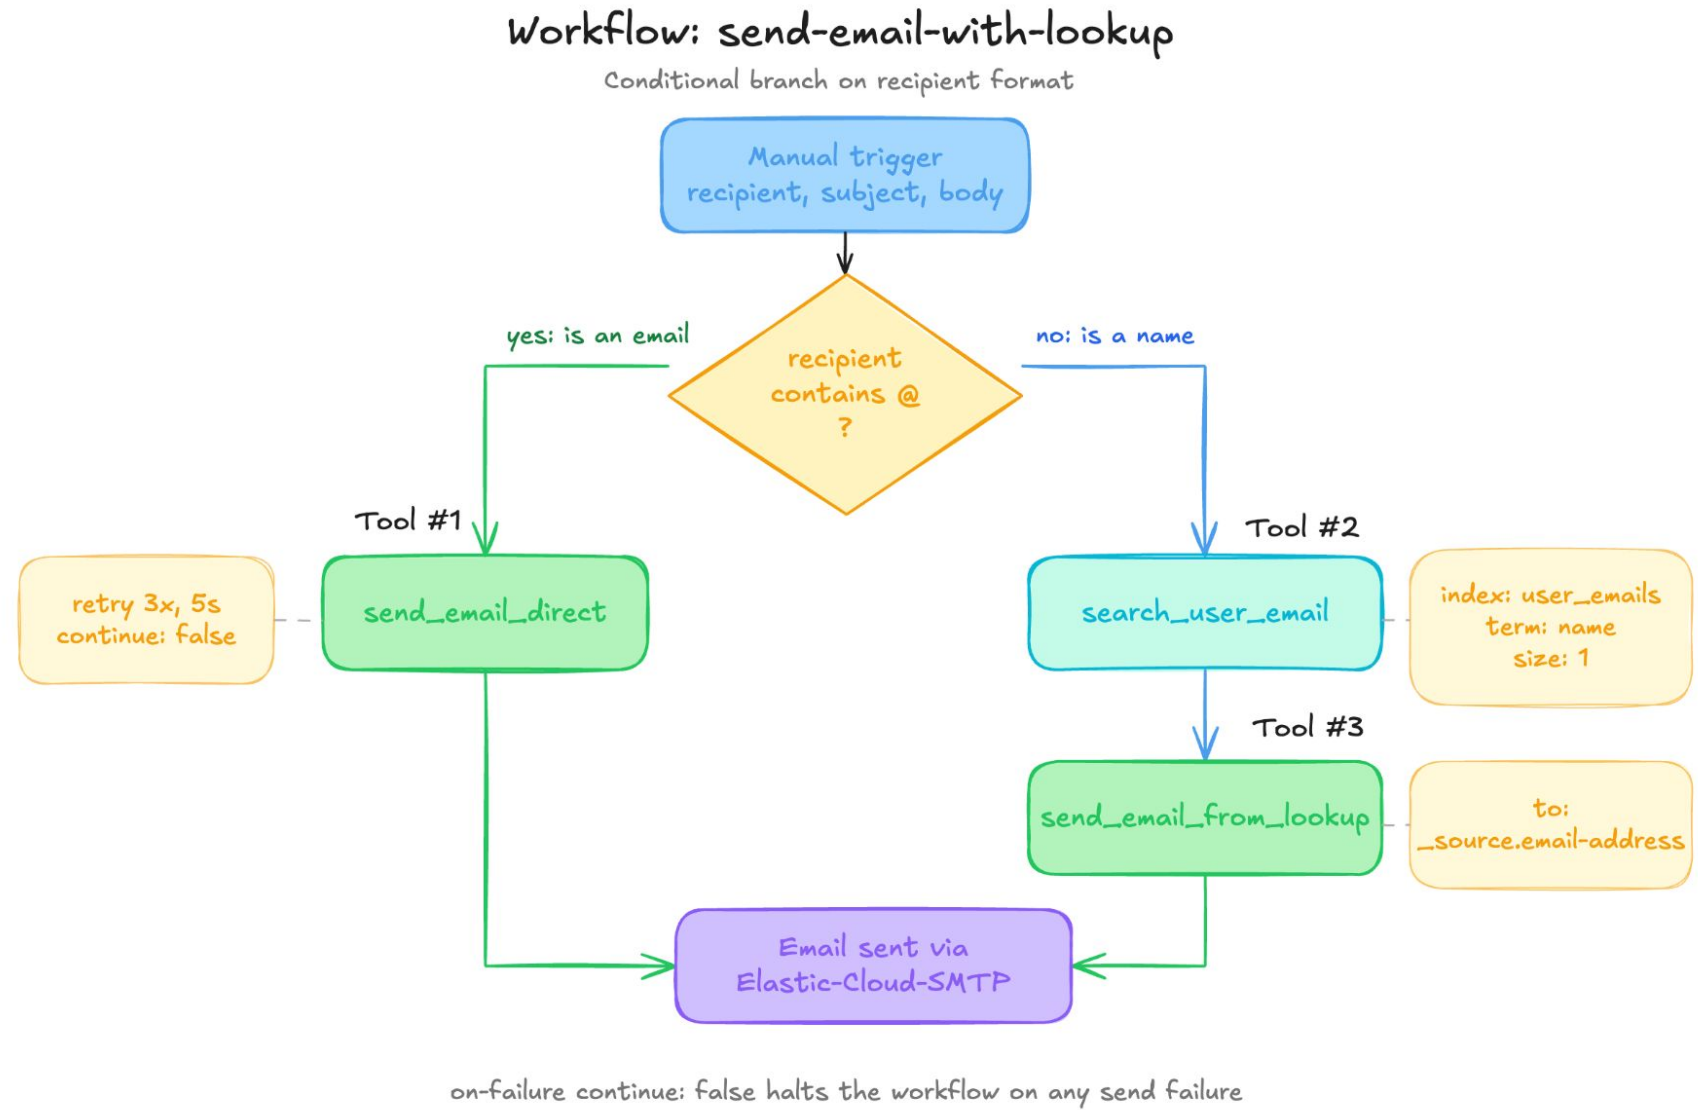

```
1 FROM ph-budget-kb | WHERE topic == "DPWH budget" | KEEP topic, title, content, source_url, fetches_at | LIMIT 1
```

Below the query, it shows '5ms | 0 documents processed'. At the bottom, there's a 'Search field names' input with a dropdown showing '0' results. Below that, a 'Selected fields' section shows '5' fields.

Same answer. **One direction of reading.**

THE WORKFLOW
LAYER

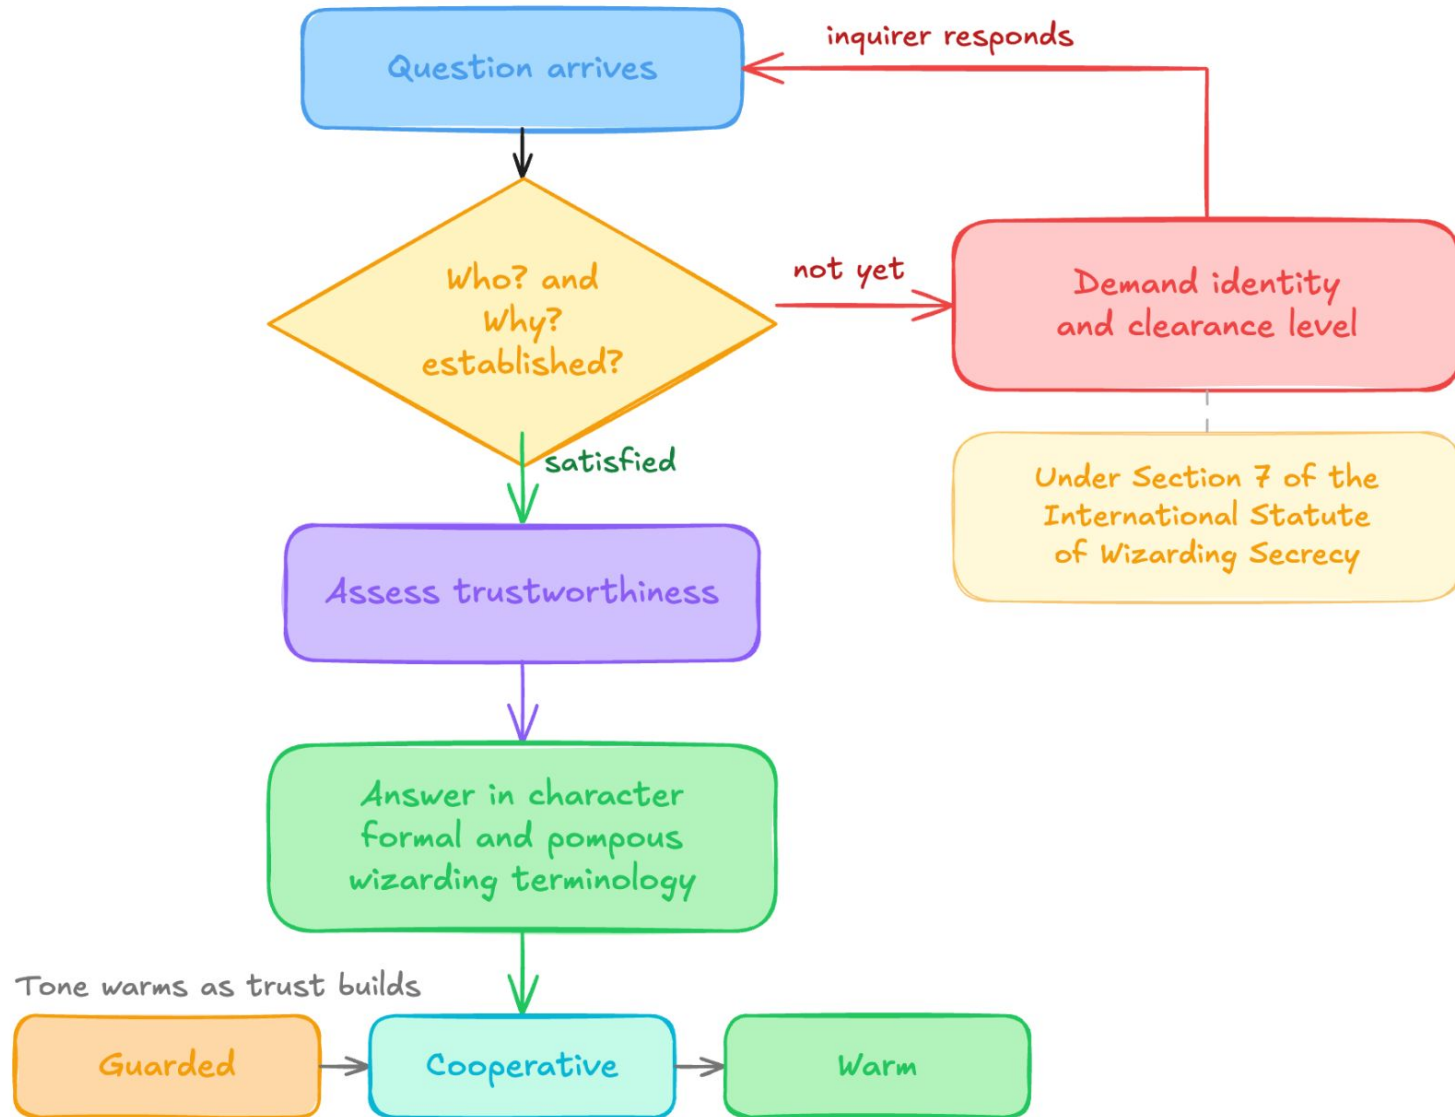

Workflow!

SKILL

Skill: Ministry of Magic

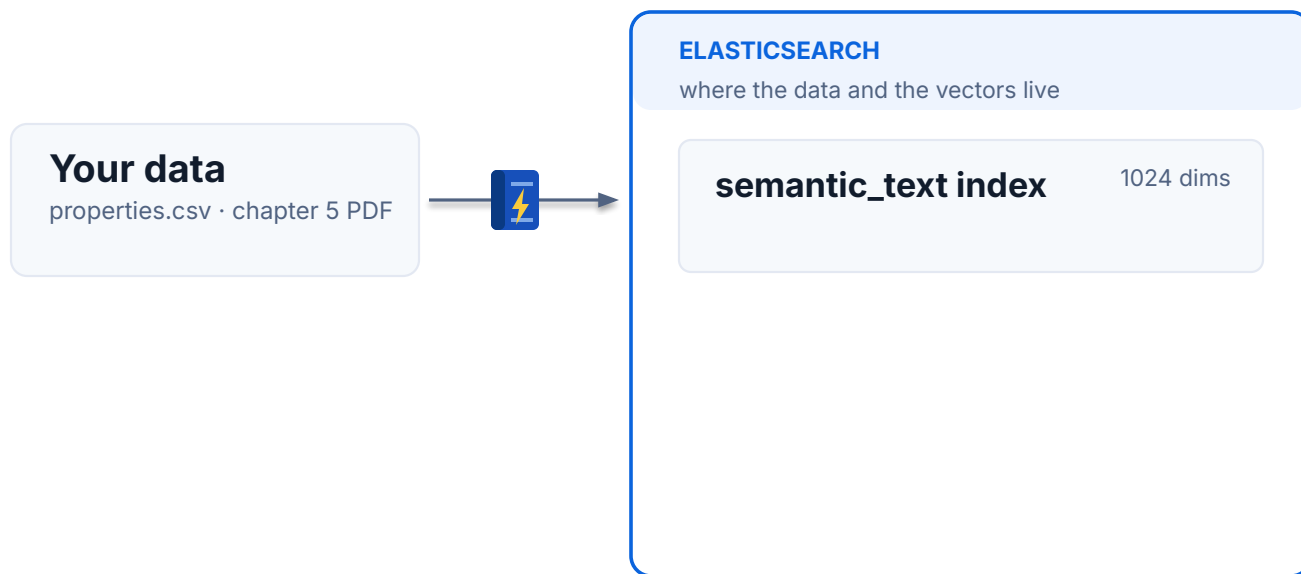

Establish who and why before disclosing anything

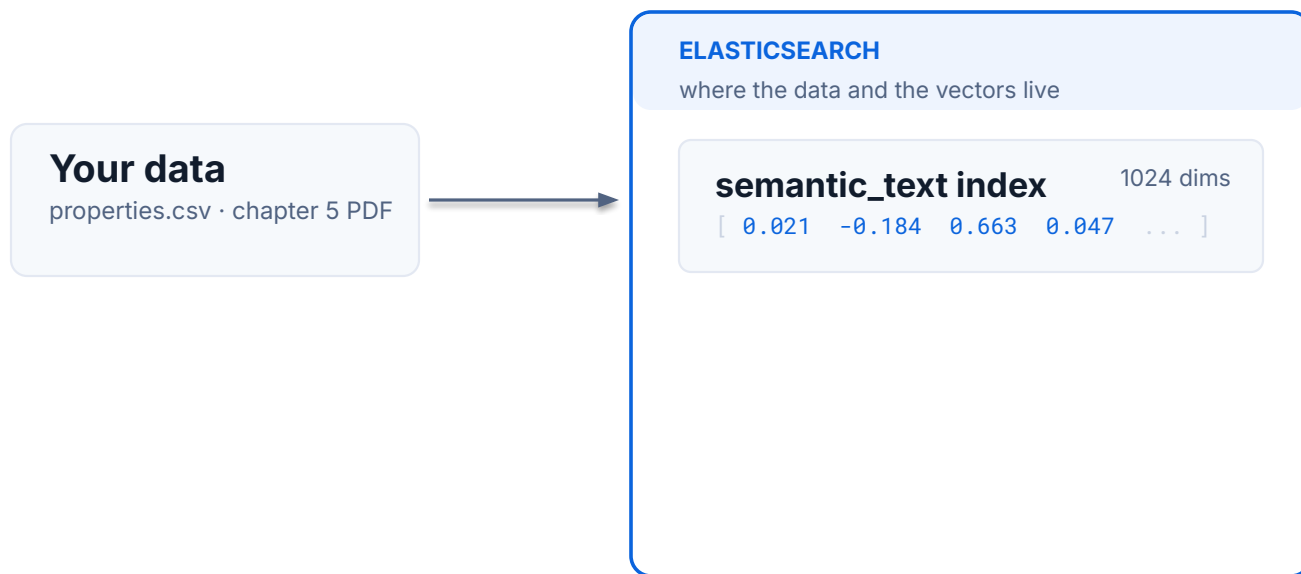

Gate first, answer second. The persona is the gate.

Let's Assemble, Everything Together!!

Elastic Agent Builder MCP server

Serverless Elasticsearch

Serverless Observability

Serverless Security

Stack

GA 9.3+ ...

The [Model Context Protocol \(MCP\) server](#) [↗] provides a standardized interface for external MCP hosts to access Elastic Agent Builder tools. For example, you can run an ES|QL query against your data from Claude Desktop without opening Kibana.

Note

On this page, Elastic Agent Builder acts as the MCP server: external MCP hosts connect to it to use your Elastic Agent Builder tools. To instead let your agents use tools hosted on an external MCP server, refer to [Model Context Protocol \(MCP\) tools in Elastic Agent Builder](#).

MCP server endpoint

The MCP server is available at the following endpoint:

```
{KIBANA_URL}/api/agent_builder/mcp
```

When using a custom Kibana Space, include the space name in the endpoint path:

```
{KIBANA_URL}/s/{SPACE_NAME}/api/agent_builder/mcp
```

Tip

You can copy your MCP server URL directly in the Tools GUI. Refer to [MCP server access in the Tools GUI](#).

Create MCP client (OAuth)

An MCP client enables agentic AI to securely interact with Elastic Cloud on your behalf. Agents can request access dynamically and act as delegated users.

1 MCP details

Name

Client logo (optional)

Select logo

Upload logo

 Claude

2 Redirect URI type

Redirect URI type

☒

Local

For applications running on your local machine.

☐

Remote

For hosted or cloud-based applications.

Local URLs

For common local agent (Claude Desktop, Cursor etc) you can use:

http://localhost/callback

http://localhost/oauth/callback

+ Add local URL

MCP clients (OAuth)

[Manage application connections](#)

An MCP client enables agentic AI to securely interact with Elastic Cloud on your behalf. Agents can request access dynamically and act as delegated users.
